

**AMENDMENTS TO THE CLAIMS**

1. (Previously Presented) An image recognition device, for detecting arbitrary images, comprising:

an element matching means arranged and configured to match an input image with target pattern elements obtained by dividing a target pattern into a plurality of target pattern elements along the shapes in the target pattern; and

a pattern detection means arranged and configured to recognize whether said input image includes said target pattern by comparing position data of matching pattern elements output by said element matching means with multiple magnification reference arrangement data of each of said target pattern elements;

wherein said multiple magnification reference arrangement data corresponds to magnification levels no greater than a level at which a human eye can readily distinguish between an original and a non-zero magnification of the original.

2. (Previously Presented) An image recognition device, for detecting arbitrary images, comprising:

a dictionary generating unit arranged and configured to store dictionary data for each of a plurality of target pattern elements obtained by dividing a target pattern along the shapes in the target pattern;

an element matching unit arranged and configured to match an input image against said dictionary data stored in said dictionary generating unit;

an arrangement data generating unit which stores position data representing an arrangement of each of the target pattern elements at a plurality of magnifications, each of said plurality of magnifications being no greater than a level where a human eye can readily distinguish between an original and a non-zero magnification of the original; and

a pattern detection unit which, based on the output of said element matching unit and said position data from said arrangement data generating unit, determines whether said target pattern can be found in said input image.

3. (Original) The image recognition device of claim 2, wherein said dictionary generating unit comprises a software routine.
4. (Original) The image recognition device of claim 2, wherein said element matching unit comprises a software routine.
5. (Original) The image recognition device of claim 2, wherein said arrangement data generating unit comprises a software routine.
6. (Original) The image recognition device of claim 2, wherein said pattern detection unit comprises a software routine.

7. (Previously Presented) An image processing device comprising:

an element matching means to match an input image with target pattern elements obtained by dividing a target pattern into a plurality of target pattern elements along the shapes in the target pattern;

a pattern detection means to recognize whether said input image includes said target pattern by comparing position data of matching pattern elements output by said element matching means with multiple magnification reference arrangement data of each of said target pattern elements,

wherein said multiple magnification reference arrangement data corresponds to magnification levels no greater than a level at which a human eye can readily distinguish between an original and a non-zero magnification of the original; and

a control means to control output of said input image to an output device when said pattern detection means recognizes said input image includes said target pattern.

8. (Original) The image processing device of claim 7, wherein said output device comprises a printer.

9. (Original) The image processing device of claim 7 further comprising a scanner to input said input image into said image processing device.

10. (Original) The image processing device of claim 7 further comprising a digital camera to input said input image into said image processing device.

11. (Original) The image processing device of claim 7 further comprising a floppy disc to input said input image into said image processing device.
12. (Original) The image processing device of claim 7 further comprises a personal computer to facilitate copying of said input image.
13. (Currently Amended) A computer-readable recording medium containing computer code for implementing an image recognition method for detecting arbitrary images said computer-readable recording medium comprising:

a storage area having stored thereon a computer code, said computer code comprising:

an element matching means arranged and configured to match an input image with target pattern elements obtained by dividing a target pattern into a plurality of target pattern elements along the shapes in the target pattern; and

a pattern detection means executable by said computer causing said computer to recognize whether said input image includes said target pattern by comparing position data of matching pattern elements output by said element matching means with multiple magnification reference arrangement data of each of said target pattern elements;

wherein said multiple magnification reference arrangement data corresponds to magnification levels no greater than a level where a human eye can readily distinguish between an original and a non-zero magnification of said original.

14. (Previously Presented) A method of processing an image, said method comprising:

dividing a target pattern into a plurality of target pattern elements along the shapes in the target pattern, said target pattern being an arbitrary pattern;

determining reference arrangement data for each of said target pattern elements at a plurality of magnifications, said plurality of magnifications being no greater than a level where a human eye can readily distinguish between an original and a non-zero magnification of said original;

inputting data for an input image;

matching said input image with said target pattern elements to determine whether said target pattern elements can be found in said input image;  
and

comparing position data of target pattern elements found in said matching with said reference arrangement data to determine whether said input image includes said target pattern.

15. (Canceled)
16. (Previously Presented) The method of claim 14, further comprising halting if said input image includes said target pattern.

17. (Previously Presented) The method of claim 14 further comprising changing the color of a reproduction of said input image if said input image includes said target pattern.
18. (Previously Presented) The method of claim 14 further comprising reducing the resolution of a reproduction of said input image if said input image includes said target pattern.
19. (Previously Presented) The method of claim 14 further comprising superimposing an alphanumeric character on top of a reproduction of said input image if said input image includes said target pattern.
20. (Previously Presented) The image recognition device of claim 1, wherein each of said multiple magnification reference arrangement data corresponds to a magnification level no greater approximately 15%.
21. (Previously Presented) The image recognition device of claim 2, wherein each of said plurality of magnifications is no greater than approximately 15%.
22. (Previously Presented) The image processing device of claim 7, wherein each of said multiple magnification reference arrangement data corresponds to a magnification level no greater than approximately 15%.
23. (Currently Amended) The computer-readable ~~recording~~ medium of claim 13, wherein each of said multiple magnification reference arrangement data corresponds to a magnification level no greater than approximately 15%.
24. (Previously Presented) The method of claim 14, wherein each of said plurality of magnifications is no greater than approximately 15%.

25. (Previously Presented) The image recognition device of claim 1, wherein said position data comprises the center point of each matching pattern element output by said element matching means.
26. (Previously Presented) The image processing device of claim 7, wherein said position data comprises the center point of each matching pattern element output by said element matching means.
27. (Currently Amended) The computer-readable ~~recording~~ medium of claim 13, wherein said position data comprises the center point of each matching pattern element output by said element matching means.
28. (Previously Presented) The method of processing an image of claim 14, wherein said position data comprises the center point of each target pattern element found in said matching.
